Ségur-certified DRIMbox: technology working for patients and doctors

It is official: our DRIMbox, natively integrated into our PACS, has gained Ségur de la Santé certification. This achievement rewards the hard work of our R&D teams, and we are proud to be among the first three vendors to reach this milestone.

Putting the patient at the heart of our approach

We joined the national Ségur programme because it tangibly improves patient care. As a leading PACS vendor in France, we wanted to make an active contribution rather than simply distributing a third-party solution.

For the patient, this means viewing and storing their medical imaging examinations via "Mon espace santé", with centralised access to their medical history. The DRIMbox orchestrates these exchanges.

A concrete benefit for doctors

The DRIMbox integrates naturally with our PACS platform. Practitioners find all the Ségur features within their usual working environment, without any additional tools or interface changes.

Designed in collaboration with our clients, this user-friendly design provides:

- direct access to DMP (shared medical record) documents;
- search filters;
- an examination viewer with measurement tools;
- straightforward retrieval of examinations within the PACS.

The objective: to enable healthcare professionals to focus on their core profession.

Expertise designed for Europe

This project is part of our R&D investment strategy. The know-how acquired with Ségur prepares us for the European Health Data Space (EHDS), which we will be able to support across Europe.

Simplicity and quality, in France and across Europe

With this accreditation, Telemis reaffirms its commitment: to make Ségur a driver of simplicity and quality for patients and doctors alike. We will continue to support the evolution of digital health with a pragmatic and human-centric vision.
